Introduction to Southwest Hot Springs

The southwestern region, encompassing states like Arizona, New Mexico, Utah, Nevada, and parts of California, is characterized by its volcanic activity, sedimentary formations, and geothermal reservoirs. These geological features create ideal conditions for hot springs—natural outlets where

heated groundwater emerges from the Earth's crust.

Many of these springs are not only scenic but also historically significant, having served as sacred sites for indigenous tribes and later as popular destinations for settlers and modern travelers. - The mineral composition varies but commonly includes silica, sulfur, calcium, magnesium, and other trace elements.
- The temperature of these waters can range from warm (around 90°F) to boiling (over 200°F), depending on depth and geothermal activity.
