Introduction to Fetal Pig Dissection

Fetal pig dissection serves as an excellent model for studying mammalian anatomy because of its similarity to human systems and its accessibility. The dissection process involves careful removal and examination of organs and tissues to identify their structure and understand their roles.

Key objectives include:

- Identifying major organs and organ systems.
- Understanding the relationships between structures.
- Learning the functions of various organs.
- Appreciating the complexity and integration of biological systems.

External Anatomy and Surface Features

Before delving into internal structures, it's essential to familiarize yourself with external features:

- Nostrils (Nares): Openings for respiratory intake.
- Mouth: Entry point for food and air.
- Ears: For hearing; external structures often called pinnae.
- Limbs: Forelimbs and hindlimbs with claws.
- Genital papilla: External reproductive structure in females.
- Urogenital opening: Located ventrally, near the tail in females.
- Umbilical cord: Connects the fetus to the placenta; present in fetal pigs.

Understanding external anatomy provides context for internal organ placement and function.

Internal Anatomy: Major Organ Systems

Fetal pig dissection reveals various organ systems, each with specific roles vital to survival and development. The main systems include the respiratory, circulatory, digestive, excretory, reproductive, endocrine, and nervous systems.

Respiratory System

Key Structures:

- Nasal Cavity: Located just inside the nostrils; lined with mucus membranes.
- Pharynx: Connects nasal cavity to larynx; part of both respiratory and digestive pathways.
- Larynx (Voice Box): Contains vocal cords; connects to trachea.

Common Dissection Questions and Answers

Q1: How can you differentiate between the stomach and the intestines?

A: The stomach is a sac-like, J-shaped organ that appears more muscular and is located on the left side of the abdominal cavity. The small intestines are coiled, thinner, and more delicate, while the large intestine is wider and frames the small intestine, leading to the rectum.

Q2: What are the functions of the liver and gall bladder?

A: The liver produces bile, an important digestive fluid that breaks down fats. The gall bladder stores and concentrates bile, releasing it into the small intestine to aid digestion.

Q3: How do the respiratory and circulatory systems work together?

A: The respiratory system supplies oxygen to the blood via the lungs, where gas exchange occurs.

The circulatory system then transports oxygenated blood to tissues and returns deoxygenated blood to the lungs for reoxygenation.

Q4: Why are the kidneys important in the fetal pig?

A: Kidneys filter blood to remove wastes and excess water, producing urine. They also help regulate blood pressure, electrolyte balance, and red blood cell production.

Q5: How do reproductive organs differ between male and female fetal pigs?

A: Females have ovaries, oviducts, a uterus, and a vagina, while males possess testes, vas deferens, and a penis. These structures develop

Question What are the main external features to identify during a fetal pig dissection? Key external features include the snout, ears, eyes, limbs, tail, and the urogenital opening.
