Error Correction Coding

Errors may occur due to noise, interference, or signal degradation. Error correction codes enable the receiver to detect and correct many types of errors, ensuring smooth playback.

Modulation and RF Transmission

Digital signals are modulated onto RF carriers suitable for the transmission medium. OFDM is commonly used in HDTV broadcasting for its robustness against multipath interference.

Reception and Demodulation

The receiver's RF front-end filters and demodulates the signals, recovering the digital data streams.

Error Correction Decoding

The decoding process identifies and corrects errors introduced during transmission, crucial for maintaining high-quality HDTV content.

Decoding and Decompression

The compressed streams are decompressed to retrieve the original high-definition video and audio data.

Display and Playback

Finally, the digital signals are converted back to analog form (if necessary) and displayed on HDTV screens, providing viewers with crisp images and immersive sound.

Importance of Block Diagram in HDTV System Design
