Sample Questions and Their Comprehensive Answers from Section 24

Providing examples of typical questions from section 24 can help illustrate how answers are structured and how they facilitate learning.

Question 1: Calculate the acceleration of a car that increases its velocity from 20 m/s to 30 m/s in 5 seconds.

Answer:

To find acceleration, use the formula:

$$a = \frac{v_f - v_i}{t}$$

Where:

- $v_f = 30 \text{ m/s}$ (final velocity)
- $v_i = 20 \text{ m/s}$ (initial velocity)
- $t = 5 \text{ seconds}$

Calculating:

$$a = \frac{30 \text{ m/s} - 20 \text{ m/s}}{5 \text{ s}} = \frac{10 \text{ m/s}}{5 \text{ s}} = 2 \text{ m/s}^2$$

Therefore, the acceleration of the car is 2 meters per second squared.

Question 2: Explain how Newton's Second Law applies to a falling object.

Answer:

Newton's Second Law states that:

$$F = ma$$

Where:

- F is the net force acting on the object
- m is the mass of the object
- a is the acceleration

For a falling object near Earth's surface, gravity exerts a force:

$$F_{\text{gravity}} = mg$$

Since gravity is the predominant force acting on the object downward, the acceleration due to gravity is:

$$a = g \approx 9.8 \text{ m/s}^2$$

This means that, neglecting air resistance, all objects in free fall accelerate downward at approximately 9.8 m/s^2 regardless of their mass, as per Newton's Second Law. The net force is directly proportional to the mass, but because the acceleration is constant, this demonstrates the

principle that all objects accelerate equally under gravity.
