Step 3: Calculate the force:

$$F = (1.6 \times 10^{-19}) \times (3 \times 10^6) \times 0.5$$

$$F = 1.6 \times 10^{-19} \times 1.5 \times 10^6$$

$$F = 2.4 \times 10^{-13} \text{ N}$$

Answer: The magnetic force acting on the proton is  $2.4 \times 10^{-13} \text{ N}$ .

## Sample Solved Exercise 2: Magnetic Field Due to a Current in a Wire (Biot-Savart Law)

Problem:

Calculate the magnetic field at a point 5 cm away from a long straight wire carrying a current of 10 A.

Solution:

Step 1: Use the Biot-Savart Law or the simplified formula for an infinitely long straight wire:

Where:

- $\mu_0 = 4\pi \times 10^{-7} \text{ T} \cdot \text{m/A}$
- $I = 10 \text{ A}$
- $r = 0.05 \text{ m}$

Step 2: Substitute the values:

Step 3: Simplify:

$$B = \frac{4\pi \times 10^{-6}}{2\pi \times 0.05}$$

$$B = \frac{4 \times 10^{-6}}{2 \times 0.05}$$

$$B = \frac{4 \times 10^{-6}}{0.1}$$

## Core Topics and Sample Types of Solved Electromagnetism Exercises

Electromagnetism encompasses an extensive range of topics. Below are some core themes along with representative solved exercises that exemplify common problem-solving approaches.

### 1. Coulomb's Law and Electric Fields

Sample Problem:

Calculate the electric field at a point P located 0.5 meters from a point charge of  $+2 \text{ } \mu\text{C}$ .

Solution Outline:

- Identify knowns:
- Charge  $(q = +2 \times 10^{-6} \text{ C})$
- Distance  $(r = 0.5 \text{ m})$
  
- Apply Coulomb's Law for Electric Field:

$$E = \frac{k |q|}{r^2}$$

where  $(k = 9 \times 10^9 \text{ N} \cdot \text{m}^2 / \text{C}^2)$

- Calculate:

$$E = \frac{9 \times 10^9 \times 2 \times 10^{-6}}{(0.5)^2} = \frac{18 \times 10^3}{0.25} = 72,000 \text{ N/C}$$

- Direction: Radially outward from the charge.

Educational Insight:

This exercise emphasizes the inverse-square nature of electric fields and reinforces vector directionality. It also introduces the importance of unit consistency and basic algebraic manipulation.

## 2. Electric Potential and Potential Difference

Sample Problem:

Determine the potential difference between two points A and B located 0.3 m and 0.8 m from a point charge of  $-3 \text{ } \mu\text{C}$ .

Solution Approach:

- Identify knowns:
- $(q = -3 \times 10^{-6} \text{ C})$
- $(r_A = 0.3 \text{ m}), (r_B = 0.8 \text{ m})$

- Use the potential formula:

$$V = \frac{k q}{r}$$

- Calculate potentials at A and B:

$$V_A = \frac{9 \times 10^9 \times (-3 \times 10^{-6})}{0.3} = -90,000 \text{ V}$$

$$V_B = \frac{9 \times 10^9 \times (-3 \times 10^{-6})}{0.8} = -33,750 \text{ V}$$

- Potential difference:

$$V_A - V_B = -90,000 - (-33,750) = -56,250 \text{ V}$$

Learning Outcome:

This problem demonstrates the calculation of potential difference resulting from a point charge and highlights the significance of signs in potential computations.

## 3. Gauss's Theorem and Symmetry in Electric Fields

Sample Exercise:

- Apply Gauss's Law:

For a spherical shell, the electric field outside behaves as if all the charge is concentrated at the center, while inside the shell, the field is zero.

- Calculate at the surface:

$$E = \frac{k Q}{r^2} = \frac{9 \times 10^9 \times 4 \times 10^{-6}}{(0.2)^2} = \frac{36,000}{0.04} = 900,000 \text{ N/C}$$

- Direction: Radially outward.

Significance:

This exercise underscores the power of symmetry and Gauss's theorem in simplifying complex electrostatics problems.

## 4. Magnetic Fields and Biot-Savart Law

Solution Details:

- Use Biot-Savart Law:

$$B = \frac{\mu_0 I}{2 R}$$

where  $(\mu_0 = 4\pi \times 10^{-7}, T \cdot m/A)$

- Perform calculation:

$$B = \frac{4\pi \times 10^{-7} \times 2}{2 \times 0.1} = \frac{8\pi \times 10^{-7}}{0.2} = 4\pi \times 10^{-6}, T \approx 12.57 \times 10^{-6}, T$$

**Question** How do you determine the direction of the magnetic force on a moving charge in a magnetic field? The direction of the magnetic force on a moving charge is given by the

right-hand rule: point your fingers in the direction of the velocity vector, curl them toward the magnetic field lines, and your thumb will point in the direction of the force for a positive charge. For negative charges, the force is in the opposite direction. What is the significance of the Lorentz force in electromagnetism exercises? The Lorentz force ( $F = q(E + v \times B)$ ) describes the force exerted on a charged particle moving in electric and magnetic fields. Solving exercises involving this force helps understand how particles behave under electromagnetic influences, such as in devices like cyclotrons or in plasma physics. How can I solve an exercise involving the magnetic field generated by a current-carrying wire? Use Ampère's Law or the Biot-Savart Law. For simple geometries like a straight wire, apply the Biot-Savart Law to find the magnetic field at a point by integrating over the current element. For a long straight wire, the magnetic field magnitude is  $B = (\mu_0 I) / (2\pi r)$ , with direction given by the right-hand rule. What is the role of flux in electromagnetism exercises, and how do I calculate it? Magnetic flux measures the total magnetic field passing through a surface and is calculated as  $\Phi = B \cdot A \cdot \cos\theta$ , where  $B$  is the magnetic field,  $A$  is the area, and  $\theta$  is the angle between  $B$  and the normal to the surface. Flux calculations are essential in exercises involving electromagnetic induction. How do I analyze the induced emf in a coil moving in a magnetic field? Use Faraday's Law:  $\text{emf} = -d\Phi/dt$ , where  $\Phi$  is the magnetic flux through the coil. If the coil moves or the magnetic field varies, calculate the change in flux over time to find the induced emf. For a moving coil, emf can also be calculated as  $\text{emf} = B \cdot v \cdot l$ , where  $v$  is the velocity and  $l$  is the length of the coil within the magnetic field. What are common mistakes to avoid when solving electromagnetism exercises? Common mistakes include neglecting the direction of vectors, confusing electric and magnetic fields, forgetting to consider the right-hand rule, and not paying attention to units. Carefully analyze the problem, clearly define all vectors, and verify the direction of forces and fields during the solution process.

- What is the difference between a magnetic pole and an electric charge?

Answer:

- Electric Charge: A property of particles (like electrons and protons) that causes them to experience a force when placed in an electric field. Electric charges can be positive or negative.
- Magnetic Pole: The ends of a magnet where magnetic forces are strongest. Magnetic poles always come in pairs?north and south?and unlike electric charges, magnetic monopoles do not exist in nature.

Key Point: While electric charges can exist independently, magnetic poles always appear in pairs, and magnetic monopoles have not been observed.

- State and explain Coulomb's Law.

Answer:

Coulomb's Law describes the force between two point electric charges:

$$F = k \frac{|q_1 q_2|}{r^2}$$

Where:

- $F$  is the magnitude of the electrostatic force,
- $q_1$  and  $q_2$  are the magnitudes of the charges,
- $r$  is the distance between the charges,
- $k$  is Coulomb's constant ( $8.99 \times 10^9 \text{ Nm}^2/\text{C}^2$ ).

Explanation: The force is directly proportional to the product of the charges and inversely proportional to the square of the distance between them. Like charges repel, and opposite charges attract.

- Describe the right-hand rule for magnetic forces.

Answer:

The Right-Hand Rule helps determine the direction of magnetic force on a moving charge or current:

- Point your thumb in the direction of the positive charge velocity (or conventional current).
- Point your fingers in the direction of the magnetic field.
- The palm or force direction indicates the force acting on the charge.

Note: For negatively charged particles, the force direction is opposite to the palm's push.

- Explain electromagnetic induction and Faraday's Law.

Answer:

Electromagnetic Induction is the process of generating an electric current in a conductor by changing the magnetic flux through it.

Faraday's Law states:

$$\mathcal{E} = - \frac{d\Phi_B}{dt}$$

Where:

- $\mathcal{E}$  is the electromotive force (emf),
- $\Phi_B$  is the magnetic flux.

Explanation: The induced emf is directly proportional to the rate of change of magnetic flux. The negative sign indicates Lenz's Law, meaning the induced current opposes the change in flux.

Question:

Two point charges,  $+3 \text{ } \mu\text{C}$  and  $-2 \text{ } \mu\text{C}$ , are separated by a distance of 0.5 meters in a vacuum. What

is the magnitude and direction of the force between them? (Use Coulomb's constant,  $(k = 8.99 \times 10^9 \text{ Nm}^2/\text{C}^2)$ .)

Answer:

The magnitude of the electrostatic force is given by Coulomb's law:

$$F = k \times \frac{|q_1 \times q_2|}{r^2}$$

Calculating:

$$F = 8.99 \times 10^9 \times \frac{(3 \times 10^{-6})(2 \times 10^{-6})}{(0.5)^2}$$

$$F = 8.99 \times 10^9 \times \frac{6 \times 10^{-12}}{0.25}$$

$$F = 8.99 \times 10^9 \times 2.4 \times 10^{-11}$$

$$F \approx 0.2158 \text{ N}$$

Direction:

Since the charges are opposite (+ and -), the force is attractive, pulling the charges toward each other.

## 2. Magnetic Fields and Force on a Moving Charge

Question:

A proton moving at  $(2 \times 10^6 \text{ m/s})$  enters a magnetic field of strength 0.3 T perpendicular to its velocity. What is the magnetic force acting on the proton? (Charge of proton,  $(q = 1.6 \times 10^{-19} \text{ C})$ .)

Answer:

The magnetic force on a moving charge is given by:

$$F = q v B \sin \theta$$

Since the magnetic field is perpendicular ( $(\theta = 90^\circ)$ ),  $(\sin \theta = 1)$ :

$$F = 1.6 \times 10^{-19} \times 2 \times 10^6 \times 0.3$$

$$[ F = 1.6 \times 10^{-19} \times 6 \times 10^5 ]$$

$$[ F = 9.6 \times 10^{-14} \text{ N} ]$$

Note: The force acts perpendicular to both the velocity and magnetic field, causing the proton to undergo circular motion.

### 3. Electromagnetic Induction

Answer:

Faraday's law states:

$$[ \text{emf} = -N \frac{\Delta \Phi}{\Delta t} ]$$

Ignoring the negative sign (which indicates direction), the magnitude is:

$$[ \text{emf} = N \times \frac{|\Delta \Phi|}{\Delta t} ]$$

Calculating:

$$[ \text{emf} = 200 \times \frac{[0.2 - 0.1]}{0.5} ]$$

$$[ \text{emf} = 200 \times \frac{0.1}{0.5} ]$$

$$[ \text{emf} = 200 \times 0.2 = 40 \text{ V} ]$$
